

二重积分计算 (2)

微积分学堂 2024.4

二、极坐标下计算

例 7 证明概率积分 (又称 Gauss 积分) $I = \int_0^{+\infty} e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$ 的重积分方法.

证法一
$$I^2 = \left(\int_0^{+\infty} e^{-x^2} dx \right)^2 = \int_0^{+\infty} e^{-x^2} dx \int_0^{+\infty} e^{-y^2} dy$$
$$= \int_0^{+\infty} dx \int_0^{+\infty} e^{-(x^2+y^2)} dy \quad (\text{用极坐标 } x = r \cos \theta, y = r \sin \theta)$$
$$= \int_0^{\frac{\pi}{2}} d\theta \int_0^{+\infty} e^{-r^2} r dr = \frac{\pi}{4}.$$

证法二
$$I^2 = \left(\int_0^{+\infty} e^{-x^2} dx \right)^2 = \left(\int_0^{+\infty} e^{-x^2} dx \right) \left(\int_0^{+\infty} e^{-u^2} du \right) \quad (\text{令 } u = xt)$$
$$= \int_0^{+\infty} e^{-x^2} dx \int_0^{+\infty} x e^{-t^2 x^2} dt \quad (\text{二重积分换序})$$
$$= \int_0^{+\infty} dt \int_0^{+\infty} x e^{-(1+t^2)x^2} dx$$
$$= \frac{1}{2} \int_0^{+\infty} \frac{1}{1+t^2} dt = \frac{\pi}{4}.$$

注 概率积分的证明方法很多, 区别于教材, 这里用反常二重积分处理. 后续课程概率论中也较多地用到反常二重积分, 大家需有所准备.

例 8 求 $I = \iint_D |ax + by| dx dy$, $D: x^2 + y^2 \leq 1$, $a^2 + b^2 = 1$.

解
$$I = \int_0^{2\pi} d\theta \int_0^1 r^2 |a \cos \theta + b \sin \theta| dr$$
$$= \frac{1}{3} \int_0^{2\pi} |a \cos \theta + b \sin \theta| d\theta$$
$$= \frac{\sqrt{a^2 + b^2}}{3} \int_0^{2\pi} |\sin(\theta + \varphi)| d\theta \quad (\text{其中 } \tan \varphi = \frac{b}{a})$$
$$= \frac{1}{3} \int_0^{2\pi} |\sin t| dt = \frac{2}{3} \int_0^{\pi} \sin t dt = \frac{4}{3}.$$

例 9 求 $I = \iint_D (x^2 + y^2) dx dy$, 其中 $D: x^4 + y^4 \leq 1$.

解 作极坐标变换 $x = r \cos \theta, y = r \sin \theta$, 区域 D 的边界曲线为 $r = r(\theta)$,

这里 $r^4(\theta)(\cos^4 \theta + \sin^4 \theta) = 1$. 结合区域的对称性有

$$\begin{aligned} I &= 4 \int_0^{\pi/2} d\theta \int_0^{r(\theta)} r^3 dr = \int_0^{\pi/2} r^4(\theta) d\theta \\ &= \int_0^{\pi/2} \frac{d\theta}{\cos^4 \theta + \sin^4 \theta} \\ &= \int_0^{\pi/2} \frac{\sec^2 \theta d \tan \theta}{1 + \tan^4 \theta} \\ &= \int_0^{+\infty} \frac{1+t^2}{1+t^4} dt = \frac{1}{\sqrt{2}} \arctan \frac{t-t^{-1}}{\sqrt{2}} \Big|_0^{+\infty} = \frac{\pi}{\sqrt{2}}. \end{aligned}$$

例 10 求 $I = \iint_D \frac{xf_y - yf_x}{\sqrt{x^2 + y^2}} dx dy$, 其中 $D: x^2 + y^2 \leq 1$, f 是 D 上的连续可微函数.

解 作极坐标变换 $x = r \cos \theta, y = r \sin \theta$. ($r = \sqrt{x^2 + y^2}, \tan \theta = \frac{y}{x}$)

则 $f(x, y) = f[r \cos \theta, r \sin \theta]$, 记 $z = z(r, \theta) = f[r \cos \theta, r \sin \theta]$

$$f_x = z_r r_x + z_\theta \theta_x = z_r \cdot \frac{x}{r} + z_\theta \cdot \frac{-\sin \theta}{r},$$

$$f_y = z_r r_y + z_\theta \theta_y = z_r \cdot \frac{y}{r} + z_\theta \cdot \frac{\cos \theta}{r}.$$

简单计算得 $xf_y - yf_x = z_\theta$.

$$\begin{aligned} I &= \int_0^{2\pi} d\theta \int_0^1 \frac{z_\theta}{r} r dr = \int_0^1 dr \int_0^{2\pi} z_\theta d\theta \\ &= \int_0^1 f(r \cos \theta, r \sin \theta) \Big|_{\theta=0}^{\theta=2\pi} dr = \int_0^1 [f(r, 0) - f(r, 0)] dr = 0. \end{aligned}$$

$$\text{注 } z_r = f_x \cdot x_r + f_y \cdot y_r = f_x \cdot \cos \theta + f_y \cdot \sin \theta = \frac{1}{r}(xf_x + yf_y),$$

$$z_\theta = f_x \cdot x_\theta + f_y \cdot y_\theta = f_x \cdot r(-\sin \theta) + f_y \cdot r \cos \theta = -yf_x + xf_y.$$

例 11 求 $\iint_D \sqrt{\left(1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}\right) / \left(1 + \frac{x^2}{a^2} + \frac{y^2}{b^2}\right)} dx dy, D: \frac{x^2}{a^2} + \frac{y^2}{b^2} \leq 1$

解 用广义极坐标 $x = ar \cos \theta, y = ar \sin \theta$

$$I = \int_0^{2\pi} d\theta \int_0^1 \sqrt{\frac{1-r^2}{1+r^2}} ab r dr = 2\pi ab \int_0^1 \sqrt{\frac{1-r^2}{1+r^2}} r dr \quad (\text{作变换 } t = r^2)$$

$$= \pi ab \int_0^1 \sqrt{\frac{1-t}{1+t}} dt = \pi ab \int_0^1 \left(\frac{1}{\sqrt{1-t^2}} - \frac{t}{\sqrt{1-t^2}} \right) dt = \pi ab \left(\frac{\pi}{2} - 1 \right).$$
